Job Market Paper

Monetary Policy in the Presence of Tail Risks [SSRN]
Solo authored; winner of the 2026 Princeton Macro, Money, and International Finance Young Researcher Award

How far should a central bank cut rates pre-emptively when the risk of a severe contraction rises? The answer depends on the *risk-adjusted* neutral rate: the real interest rate at which monetary policy is neither expansionary nor contractionary once risk is taken into account. Disaster *risk* raises households' precautionary saving and so lowers this rate, even before any disaster strikes. A central bank that fails to track this movement inadvertently tightens policy even as it cuts rates. Using option prices, I document that disaster-risk shocks have sizeable effects on the business cycle: like negative demand shocks, they lower activity and inflation together. In a calibrated New Keynesian model, a rise in disaster risk lowers the neutral rate 1.54 times as much as a rise in volatility. Had the Federal Reserve ignored disaster risk entirely in late 2007, as a standard Taylor rule does, output would have fallen about 38 percent more than it did by early 2008. Beyond this episode, a standard Taylor rule costs households the equivalent of 1.786 percent of consumption every year relative to full tracking. Finally, I estimate the risk-adjusted neutral rate: it fell well below zero in late 2008, when policy was contractionary relative to it but accommodative relative to long-run estimates.

Working Papers

1. Our Deficit, Your Problem: Fiscal Sustainability and Exchange Rates [SSRN]
With Tobias Kawalec; submitted

- **Presentations:** 28th Macro Finance Society Workshop (poster session); 6th Oxford/Federal Reserve Bank of New York/Bank of England Monetary Economics Conference; CEPR European Economic Policy RPN; German Economic Association (VfS) Annual Conference; Econometric Society European Meeting; GRAPE; Econometric Society North American Summer Meeting; Macro, Money and International Finance Conference; LSE Macro PhD Workshop; University of Konstanz; Austrian National Bank.

2. A Macro-Finance Model of Credit Spreads [SSRN]
With Theofanis Papamichalis, Dimitrios P. Tsomocos, and Nikolaos Romanidis; submitted

- **Presentations:** Mathematics in Finance 2026; SAET–EWET 2026; Cowles Foundation 20th Annual Conference on General Equilibrium and its Applications; SAET 2025.

3. **Pricing the Left Tail: Consumption Skewness and Expected Returns** [SSRN]
   With Niklas Schmitz; submitted
   - **Presentations:** EEA–ESEM 2022 (Milan); IAAE Conference 2022; QCGBF Annual Conference 2022; T2M Conference 2022; Cambridge Macroeconomic PhD Workshop; CERF Lunchtime Talks; University of Oxford Internal Seminar.
4. **How to Shrink a Central Bank: The Dynamics of Quantitative Tightening** [SSRN]
   With Seung Joo Lee
5. **Supplying Safety to an Aging World: Demographics, Debt, and Risk Premia** [SSRN]
   With Tim Willems
6. **The Inequality Multiplier: Market Inelasticity and the Persistence of Wealth Inequality** [SSRN]
   With Aditya Khemka; submitted
   - **Presentations:** European Economic Association Annual Congress; ISB Summer Research; American Finance Association Annual Meeting (poster session); Bank of England Macro Brown Bag; Asian Finance Association, Taipei; Trans-Atlantic Doctoral Conference, London Business School; Rethinking Economic Theory Conference, Athens.
7. **Financial Stability Implications of Central Bank Digital Currencies: A Solution in Search of a Problem?**
   - **Presentation:** Riksbank and Bank of Canada conference on the economics of central bank digital currencies.

Publication
